

Twilio Business Verification & Client SMS Enablement

What your codebase does for Twilio, why outbound texts are gated, and the exact steps to let your client businesses register and start sending SMS.

Scope: Twilio + Toll-Free Verification (TFV)

App: nextCall (Next.js SaaS)

Prepared: 1 Oct 2026

Bottom line

Your code is **already built** to send each client's toll-free registration request (Settings → Business SMS → Submit). What is missing is entirely on the **Twilio account side**: get your master account business-verified, create an approved **ISV Primary Customer Profile** in Trust Hub, and set `TWILIO_TFV_CUSTOMER_PROFILE_SID` (plus `TWILIO_WEBHOOK_BASE_URL`). After that, each client's submission reviews and approves normally.

1 · What your Twilio setup actually is (as built)

nextCall is a multi-tenant SaaS. You are the Twilio **ISV / reseller**; every paying business is an end customer. The chain is:

Layer	What happens	Code
Master account	Your Twilio creds (<code>TWILIO_ACCOUNT_SID</code> / <code>TWILIO_AUTH_TOKEN</code>) live in <code>.env.local</code> .	<code>lib/twilio.ts</code>
Per-business subaccount	On Paddle activation, a Twilio subaccount is created per business.	<code>lib/twilio-provision.ts</code> → <code>provisionTwilioNumber()</code>
Per-business number	A US toll-free number is bought in that subaccount, wired with the voice + SMS webhooks.	<code>lib/twilio-provision.ts:85-92</code>
Outbound SMS gate	Every outbound text is blocked unless that business's TFV is <code>approved</code> .	<code>lib/sms-compliance.ts</code> → <code>sendBusinessSms()</code> / <code>isSmsApproved()</code>
Client self-serve TFV	Settings → Business SMS submits a Toll-Free Verification for that business.	<code>SmsComplianceTab.tsx</code> → POST <code>/api/sms/compliance</code> → <code>submitTollfreeVerification()</code>
State	Stored in the <code>sms_compliance</code> collection; status lazily re-synced from Twilio (max every 6h).	<code>lib/sms-compliance.ts</code> → <code>refreshComplianceStatus()</code>

So the mechanism to "let my client register to enable their SMS" **already exists** — it is the **Business SMS** tab that files a Toll-Free Verification on the client's behalf. What is missing are the Twilio-account prerequisites that make those submissions pass review.

2 · Two different "verifications" — don't mix them up

#	Which verification	Who does it & when
A	Your business verification Trust Hub Primary Customer Profile	You (the platform owner), once . Twilio now requires that your master account has an approved Trust Hub Primary Customer Profile before it will accept <i>any</i> Toll-Free Verification. Because you sell this to clients, set the business identity to "ISV Reseller or Partner." Twilio docs: <i>"TFV requests with Twilio require your business to have a Trust Hub Primary Customer Profile."</i>
B	Each client's Toll-Free Verification per business / per number	The client, via your dashboard. This is the "send request for my client to get registered to enable their SMS" part — one TFV per client toll-free number, filed from the Business SMS tab.

3 · What is blocking you right now

Findings from your code and `.env.local`:

1 No Customer Profile SID configured BLOCKING

`TWILIO_TFV_CUSTOMER_PROFILE_SID` is **not set**. Your code reads it here — and because it is unset, submissions go out **without a Customer Profile**. That is the single most likely cause of rejections / Twilio error **30494** ("ISV or reseller name must be provided").

```
// lib/sms-compliance.ts:537-539
...(process.env.TWILIO_TFV_CUSTOMER_PROFILE_SID
  ? { customerProfileSid: process.env.TWILIO_TFV_CUSTOMER_PROFILE_SID }
  : {}),
```

2 Webhook base URL not set explicitly RECOMMENDED

`TWILIO_WEBHOOK_BASE_URL` is unset and silently defaults to `https://www.getnextcall.com` (`lib/sms-compliance.ts:40`, `lib/twilio-provision.ts:10`). Fine today, but set it explicitly so staging/prod can never wire webhooks to the wrong host.

3 EIN is now required for US businesses VERIFY FORM

Twilio added mandatory **Business Registration Number** fields. US businesses must supply a valid **EIN matching the legal business name**; sole proprietors without an EIN may mark it unavailable. Your form already collects `registrationNumber` + `registrationAuthority` (EIN) and sends them (`buildCreateParams`, lines 530-536) — good — but the UI authority list is minimal and `country` is hard-defaulted to US, so non-US clients cannot register cleanly.

4 Master account must be a paid, upgraded account CHECK

The account must be upgraded (card on file), **not trial**, with Twilio's own account-level business verification complete.

4 · The exact plan — do these in order

1 Verify / complete your Twilio account (one-time)

- Twilio Console → confirm the account is **upgraded** (card on file), not trial.
- Complete Twilio's own **account business verification** (Console → Account → Business Info / the verification banner).

2 Create your approvable Primary Customer Profile (one-time)

- Console → **Trust Hub** → **Customer Profiles** → **Create Profile**.
- At "**Business Information** → **Select business identity**" choose **ISV Reseller or Partner**.
- Fill legal name, address, and a **notification email you actually monitor** — Twilio emails approval/rejection here.
- Submit and wait for the profile to show **approved**.

3 Wire the profile into the app

Copy the approved profile SID (BUxxxxxxxx...) and add it to `.env.local` and your Vercel environment:

```
TWILIO_TFV_CUSTOMER_PROFILE_SID=BUxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
TWILIO_WEBHOOK_BASE_URL=https://www.getnextcall.com
```

4 Prove the pipeline with ONE client

- For a test business: open **Settings** → **Business SMS** and fill the form — legal name, **EIN matching the legal name**, website, opt-in proof URL, Privacy & Terms URLs.
- Submit, then watch Console → **Trust Hub** → **Registrations** (or Phone Numbers → the toll-free number → Regulatory Information) to confirm the verification appears and shows your ISV identity.
- Once Twilio returns `TWILIO_APPROVED` (mapped to `approved`), `sendBusinessSms()` unblocks that business's outbound texts automatically.

5 Roll out to clients

Each client fills the same tab; each gets its own TFV on its own subaccount number. Approval is typically **2–3 business days**.

5 · One thing to confirm with Twilio (ISV scaling nuance)

Your code attaches a **single** `TWILIO_TFV_CUSTOMER_PROFILE_SID` to every business's submission. That works if Twilio treats it as your ISV/reseller profile and reads each end-business identity from the inline `business*` fields (which your code sends). At higher volume, Twilio's ISV model sometimes prefers a **separate / secondary Customer Profile per end business**. If you start seeing rejections that mention the ISV/reseller, ask Twilio support (or your account manager) whether you should create per-business profiles. One test submission (Step 4) tells you quickly.

Watch for these Twilio errors

- **30494** — "ISV or reseller name must be provided": profile business identity isn't set to ISV/Reseller, or the ISV details are missing.

- **Approved Profile is Required** — your Trust Hub Primary Customer Profile isn't approved yet.
- Rejections citing **opt-in** or **website** — the client's opt-in proof URL or privacy/terms pages are missing or unreachable.

6 · Security note (important)

Rotate exposed secrets

Your `.env.local` contains **live production secrets** in plaintext — Twilio Auth Token, Paddle **live** API key, OpenAI key, Clerk secret, and others. It is correctly gitignored (`.gitignore:34` → `.env*`), but since these values have been shared outside your machine, treat them as compromised.

- **Rotate the Twilio Auth Token** (Console → Account → API keys & tokens) and update Vercel. A leaked token lets someone hijack your whole account and every subaccount.
- **Rotate the Paddle live API key** and webhook secret.
- Consider using **Twilio API Keys** (scoped keys) instead of the account Auth Token for the master client.

7 · How to test end-to-end

1. Set the two env vars, redeploy (so `process.env` picks them up).
2. Open `/dashboard/settings?focus=sms` for a test business.
3. Submit the form; confirm the response status is **pending** (not **error**).
4. Check Twilio Console → Trust Hub → Registrations for the new verification and its ISV identity.
5. After approval, trigger an SMS feature (e.g. an appointment reminder) and confirm a message `sid` is returned — that proves `sendBusinessSms()` passed the gate.

Summary

Code side: ready. Twilio side: (1) upgrade + business-verify the master account, (2) create & get an approved **ISV Primary Customer Profile** in Trust Hub, (3) set `TWILIO_TFV_CUSTOMER_PROFILE_SID` and `TWILIO_WEBHOOK_BASE_URL`. Then every client's Business SMS submission can register and unlock their texting.
